Mr. Croom's Physics

Date: _____

Chapter 7: Rotational motion

10. (Serway, p. 264, #27) What would be the orbital speed and period of a satellite in orbit 1.44×10^8 m above Earth?
11. (Serway, p. 264, #28) A satellite with an orbital period of exactly 24.0 h is always positioned over the same spot on Earth. This is known as a geosynchronous orbit. Television, communication, and weather satellites use geosynchronous orbits. At what distance would a satellite have to orbit Earth in order to have a geosynchronous orbit?
12. (Serway, p. 264, #29) The distance between the centers of a small moon and a planet in our solar system is 2.0×10^8 m. If the moon's orbital period is 5.0×10^4 s, what is the planet?
13. (Giancoli, p. 142, # 56) Our Sun rotates about the center of the Galaxy ($M_G \approx 4 \times 10^{41}$ kg) at a distance of about 3×10^4 light-years ($1 \text{ ly} = 3 \times 10^8 \text{ m/s} \times 3.16 \times 10^7 \text{ s/y} \times 1 \text{ y}$). What is the period of our orbital motion about the center of the Galaxy?
